

7919 UNIT - 2 OPERATORS

Operators:- An operator is a symbol that tells the computer to perform various mathematical calculations.

An operator is a symbol that operates on the data or variable.

'C' language has well defined operators to perform various operations on data.

'C' provides 8 types of operators.

1, Arithmetic operators

2, Relational operators

3, Logical operators

4, Assignment operators.

5) Increment and ~~decrement~~, Decrement.

6, Conditional operators.

7, Bitwise operators

8, Special operators.

⇒ Arithmetic operators: 'C' provides 5 types

of arithmetic operators. It is used

to perform mathematical operations

such as addition, subtraction, multiplication

Division and modulus division.

Operator	Meaning.	
+	Addition	$b=10, b=2$ Example $a+b = 10+2=12$
-	Subtraction	$a-b = 10-2=8$
*	multiplication	$a*b = 10*2=20$
÷	Division	$a/b = 10/2=5$
%	Modulus division	$a \% b = 10 \% 3 = 1$

$$\Rightarrow 9 \% 2 \rightarrow 1$$

$$9.0 \% 2 \rightarrow \text{error}$$

$$9.0 \% 2.0 \rightarrow \text{error}$$

$$9.0 \% .2.0 \rightarrow \text{error}$$

$$9/2 \rightarrow 4 \quad (\frac{\text{Int}}{\text{Int}} = \text{Int})$$

$$9.0 / 2 \rightarrow 4.5$$

$$9/2.0 \rightarrow 4.5$$

$$9.0 / 2.0 \rightarrow 4.5$$

$$\left(\frac{\text{float}}{\text{float}} = \text{float} \right)$$

$\Rightarrow +, -, *, /$ are integer float operators.
 but $\%$ only for integer. If can't be used
 on floating point data it is a integer
 operator.

$$2/2 \rightarrow 0 ; \quad 2.0/2 \rightarrow 0.22.$$

$$-14/-2 = 2$$

$$-14/2 = -2$$

$$14/2 = 2$$

$$14/-2 = -2$$

$\left. \begin{array}{l} \text{Sgn of 1st operator} \\ \text{is sign of the} \\ \text{result.} \end{array} \right\}$

Example:-

Write a 'c' program to add, sub, mul, division.

```
#include <stdio.h>
Void main()
{
    int a=10, b=2;
    printf ("a+b = %.d\n", a+b);
    printf ("a-b = %.d\n", a-b);
    printf ("a*b = %.d\n", a*b);
    printf ("a/b = %.d\n", a/b);
    printf ("a%b = %.d\n", a%b);
}
```

O/P :- $a+b = 12$

$a-b = 8$

$a*b = 20$

$a/b = 5$

$a \% b = 0$

Q. Write a 'c' program to convert no. of days into months and dates.

```

Ans #include <stdio.h>
void main()
{
    int months, days;
    printf ("enter no. of days");
    scanf ("%d", &days);
    months = days / 30;
    days = days % 30;
    printf ("months = %d days = %d", months, days);
}

```

Op-qualif = *Relational operator :- * =

A relational operator checks relationship between two operands (variables, constant). If the relation (condition) is true it is written 1 (true). If the condition is false it is written 0.

A relational operators are used for comparison of values of two variables (to compare two quantities values). It is used in decision making statements or in loops.

'C' provides 6 types of relational operators
 $>$, $<$, \geq , \leq , $=$, \neq

<u>Operator</u>	<u>Description</u>	<u>Example</u>	<u>return value</u>
$>$	Greater than	$10 > 5$	1 (true)
$<$	less than	$10 < 5$	0 (false)
\geq	greater than or equal to	$10 \geq 5$	0 (false)
\leq	less than equal to	$10 \leq 5$	0 (false)
$=$	equal to	$10 = 5$	0 (false)
\neq	not equal to	$10 \neq 5$	1 (true)

Q. Write a 'C' programme to greater, less, greater than or equal to, less than or equal to, equal to and not equal to.

```
#include <stdio.h>
Void main()
{
    int a=5, b=2;
    printf ("a>b=%d\n", a>b);
    printf ("a<b=%d\n", a<b);
    printf ("a>=b=%d\n", a>=b);
    printf ("a<=b=%d\n", a<=b);
    printf ("a==b=%d\n", a==b);
    printf ("a!=b=%d\n", a!=b);
```

- Op's
- $a > b = 1$
 - $a < b = 0$
 - $a \geq b = 0$
 - $a \leq b = 0$
 - $a = b = 0$
 - $a \neq b = 1$

Logical operators =

If is used to check / test more than one condition and make decision.

(Q) If is used to evaluate two or more conditions.

→ If is used to combine two or three relational expressions. 'C' provides 3 types of logical operators.

1, Logical And (88)

2, Logical OR (11)

3, logical NOT (!)

1, Logical And (88) :- If performs logical multiplication

2, Logical OR (11) :- If performs logical addition

And truth table

OP ₁	OP ₂	Result
T	T	T
T	F	F
F	T	F
F	F	F

* OR truth table

OP ₁	OP ₂	Result
T	T	T
T	F	T
F	T	T
F	F	F

* Not truth table

OP ₁	Value
T	F
F	T

Operator	Meaning	example	result
&&	logical AND	$7 > 3 \&& 7 < 5$	T T
	logical OR	$7 > 10 11 < 3$	F T
!	logical NOT	$! (7 = 7)$	0

* #include <stdio.h>
void main()
{
int a=6 , b=2;
printf("a>b=%d\n", a>b);

11/9/19 (4) Assignment Operators

- It is used to assign a value to a variable.
- (or) It is used to assign the result of an expression to the variable.

* Syntax of the Assignment operators are:-

Variable name Operator Constant / Variable

/ expression ; (or) $\boxed{V = \text{exp}}$.

Eg:- $a=5$; $b=a$; $c=a+b$; $c=10$; $b=5$;

Operative	meaning	Example	short hand operation
1, =	assign	$a=b$	$\boxed{a=2; b=5}$
2, +=	increment than assign	$a+=b$	$\begin{aligned} a &= 2 \\ a &= a+b \\ a &= 5+2=7 \end{aligned}$
3, -=	Decrement than assign	$a-=b$	$\begin{aligned} a &= a-b \\ a &= 5-2=3 \end{aligned}$
4, *=	multiply than assign	$a*=b$	$\begin{aligned} a &= a*b \\ a &= 5*2 \\ a &= 10 \end{aligned}$
5, /=	Division than assign	$a/=b$	$\begin{aligned} a &= a/b \\ a &= 5/2 \\ a &= 2.5 \end{aligned}$
6, %=	modulus division than assign	$a\%b=b$	$\begin{aligned} a &= a \% b \\ a &= 5 \% 2=1 \end{aligned}$

Q. Write a 'C' program to assignment operator

```
#include <stdio.h>
```

```
void main()
```

```
{ int a=10, b=2;
```

```
a+=2;
```

```
printf ("%d\n", a);
```

```
a-=2;
```

```
printf ("%d\n", a);
```

```
a*=2;
```

```
printf ("%d\n", a);
```

```
a/=2;
```

```
printf ("%d\n", a);
```

```
a%2;
```

```
printf ("%d\n", a);
```

```
}
```

Op:-

$$a = a + 2 = 12$$

$$a = a - 2 = 8$$

$$a = a * 2 = 20$$

$$a = a / 2 = 5$$

$$a = a \% 2 = 0$$

⑤ Increment & Decrement Operators :-

- Increment & Decrement operators are used to change the value of an operator constant & variable by '1'. Those operators are called unary operators.
- ⇒ C provide 2 types of increment & decrement operators are ++ & -- .

$$\boxed{x = 20 \quad y = 10} =$$

- $Z = x * \underline{y++} = 200 + 10 = 210$

- $a = x * y = 20 \cancel{*} 11 = 220$

- $Z = x * \underline{+y} = 200 + 20$

- $a = x * y = 220$

i.e.,	<u>Operator</u>	<u>meaning</u>
	++	Increment
	--	Decrement

⇒ Increment (++) operator :- It increases the value by 1. (or) It adds 1 to the operand.

⇒ Decrement (--) operator :- It decreases the value by 1. (or) It subtracts 1 value from the operands.

$$\text{Eg:-} \left. \begin{array}{l} ++a \text{ (or) } a++ \Rightarrow a = a+1 \text{ (or) } a+1 \\ --a \text{ (or) } a-- \Rightarrow a = a-1 \text{ (or) } a-1 \end{array} \right\}$$

①

$$\Rightarrow a = 10 \quad a = 10 \\ \quad \quad \quad a++ \quad \quad \quad ++a \\ \quad \quad \quad a = ? \quad \quad \quad a = ? \\ \quad \quad \quad 11 \quad \quad \quad 11$$

②

$$\Rightarrow a = 5 \quad a = 5 \\ \quad \quad \quad b = ++a \quad \quad \quad b = a++ \\ \quad \quad \quad b = 6 \quad \quad \quad b = ? \\ \quad \quad \quad a = 6 \quad \quad \quad a = 6$$

*Preincrement (or) Prefix:-

When prefix $\{++\}$ or $\{--\}$ is used on expression, when the variable is incremented or decremented by 1 and then the expression is evaluated using the new value of variable.

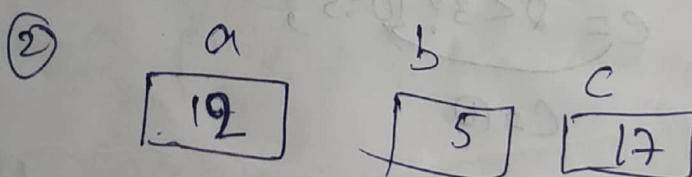

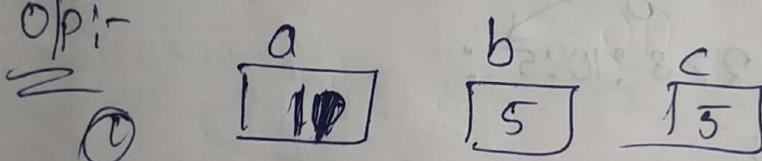

*Post increment (or) suffix.

When postfix $\{++\}$ or $\{--\}$ is used on expression, the variable expression is evaluated 1st using the original value of the variable and then the variable is incremented or decremented by 1.

Example Program

```
#include <stdio.h>
void main()
{
    int a=10, b=5, c=, d;
    c = a++ - b;
    printf ("a=%d\n b=%d\n c=%d\n", a,b,c);
    d = ++a + b;
    printf ("a=%d\n b=%d\n d=%d", a,b,d);
}
```

Op:-

→ Conditional operator:-

It is used called as ~~ternary~~ operator.
(It takes 3 operands). It is used to
construct conditional expression (or) evaluate
expression.

- C provides only 1 operator:-
operator means conditional Operator.

- The conditional operator takes own symbol
- * Syntax : Variable = (conditional)? Exp1:Exp2

$$\text{Variable} = \text{exp1?exp2:exp3};$$

(or)

* It contains conditions and then followed by 2 values / expressions.

- the conditional operator written by returns 1 value, if the condition is true and another value, if the condition is false.

- It ~~writes~~ returns only 1 value at a time.

Ex:- $c = 2 > 3 ? 10 : 5;$
 $c = 5$

$c = 2 < 3 ? 10 : 5;$

$c = 10$

- Write a c programme to find greatest of two numbers using conditional operators

#include <stdio.h>

Void main()

{

int a, b, c;

printf ("enter the ab values\n");

scanf ("%d %d", &a, &b);

c = (a>b)?a:b;

printf ("the greater no. of the is %d", c);

}

Output a=5 ; b=2.

∴ c = 5 > 2 ? 5 : 2

c=5

• Write a C programme to find greatest of 3 numbers using conditional operators.

#include <stdio.h>

void main()

{

int a, b, c, d, e;

printf ("enter the a, b values");

scanf ("%d %d", &a, &b);

d = (a>b)?a:b;

printf ("enter the d, c values");

scanf ("%d %d", &d, &c);

e = (d>c)?d:c;

printf ("the greater no. of the is %d", e);

}

Bitwise Operator:-

It is used to perform bit level operation (low level operation). It is used for manipulation of data at bit level. These operators works on bits (0 & 1) and perform bit level operations.

- C provides 6 types of Bitwise operator

<u>Operator</u>	<u>Mean</u>
&	Bit and
!	Biton
\wedge	Bit - XOR (exclusive OR)
\sim	Bitnot (complement)
$>>$	Rightshift
$<<$	leftshift

*Truth table:-

A	B	$A \& B$	A / B	$A \wedge B$	$\sim A$
0	0	0	0	0	1
0	1	0	1	1	1
1	0	0	1	1	0
1	1	1	1	0	0

Ex:- $a=8 ; b=4$

* $a \& b \rightarrow 8 \& 4 =$

Example :- $a = 8, b = 4.$

Q) Write a 'C' program on bitwise And

#include <stdio.h>

Void main ()

{

int a, b, c ;

Printf ("enter the values\n");

Scanf ("%d %d", &a, &b);

c = a & b;

Print ("the result is %d\n", c);

}

Op:- 8 & 3 → 0

4 & 13 → 7

8 | 4 → 12

$$\begin{array}{r} 8 \leftarrow 0 \\ 2 \mid 4 \leftarrow 0 \\ 2 \mid 2 \leftarrow 0 \\ 1 \leftarrow 0 \end{array}$$

$$\begin{array}{r} 4 \\ 2 \mid 2 \leftarrow 0 \\ 1 \leftarrow 0 \end{array}$$

$$\begin{array}{r} 1000 \\ 0100 \\ \hline 1100 \\ 2^3 \ 2^2 \ 2^1 \ 2^0 \end{array} \Rightarrow 2^3 \times 1 + 2^2 \times 1 + 2^1 \times 0 + 2^0 \times 0 = 12$$

12

Program on bitwise OR

```
#include <stdio.h>
void main()
{
    int a, b, c;
    printf("enter the values\n");
    scanf("%d%d", &a, &b);
    c = a | b;
    printf("the result is %d\n", c);
}
```

O/P:- 8/4 → 12

Program on bitwise XOR

```
#include <stdio.h>
void main()
{
    int a, b, c;
    printf("enter the values\n");
    scanf("%d%d", &a, &b);
    c = a ^ b;
    printf("the result is %d\n", c);
}
```

O/P:-

8/4 → 12

5/4 → 11

0/4 → 0

1/4 → 1

2/4 → 2

3/4 → 3

4/4 → 4

* Special Operators:-

'C' supports some special operators
they are.

① comma operator

② sizeof operator

* Comma operator(,):-

It is used to separate two or more
expression / values.

Eg:- int a, b, c;

int a=10, b=20, c=30;

printf (" %d %d %d ", 5+3, 5-3, 5*3);

* sizeof operator
It is written as It returns/give
the size of data type of variable.

Eg:- int a = 10;

printf("%d", sizeof(a)); (2)

printf("%d", a); (10)

⇒ Program on sizeof operator:

#include <stdio.h>

Void main()

{

printf("%d", sizeof(char)); = 1

printf("%d", sizeof(short)); = 2

printf("%d", sizeof(int)); = 4

printf("%d", sizeof(long)); = 8

printf("%d", sizeof(float)); = 4

printf("%d", sizeof(double)); = 8

printf("%d", sizeof(long double)); = 10

}

Output

1

1

8

1

10

2

4

Operator

Symbol representation

Arithmetic operator

+ , - , * , / , %

Relational operator

= = , \neq , \geq , \leq , !=

Logical operator

||, !

Binary

Assignment

=, +=, -=, *=, /=,

Increment &
Decrement

++, --

→ Unary

Conditional operator

? :

Bitwise operator

&, |, ^, ~, >>, <<

Special operator

, sizeof

Ternary

Q1 = ((float) sizeof("ba"))

Q2 = ((double) sizeof("ba"))

Q3 = ((char*) sizeof("ba"))

```

#include <stdio.h>
void main()
{
    int a, b, c, d;
    a = 15; b = 10;
    c = ++a - b; → 10
    printf("a = %d\n b = %d\n c = %d\n", a, b, c);
    d = b + a; → 26
    printf("a = %d\n b = %d\n d = %d\n", a, b, d);
    printf("%d", a / b); → 1
    printf("%d", a * b); → 5
    printf("%d", a >= b); → 0
    printf("%d", a > b && c > d); → 0
    printf("%d", a * b); → 15 * 10 = 150
    printf("%d", a & b); → 10 & 10
    printf("%d", a >> 3); → 2 >
    printf("%d", c > d ? 1 : 0); → 0 > 26 = 0
    printf("%d", sizeof(a)); → 2
}

```

① Write a C program to swap two numbers using 3rd variable?

```
#include <stdio.h>
```

```
Void main()
```

```
{
```

```
int a,b,t;
```

```
Printf ("Enter the values\n");
```

```
Scanf ("%d %d", &a, &b);
```

```
Printf ("before swapping a=%d\n b=%d", a,
```

```
t=a;
```

```
a=b;
```

```
b=t;
```

```
Printf ("after swapping a=%d\n b=%d", a,
```

```
}
```

Q:- a=10

t=a

a	b	t
20	10	10

b=20

t=10

a=20

b=10

② Write a C program to swap two numbers without using 3rd variable?

```
#include <stdio.h>
```

```
Void main()
```

```
{
```

```
int a,b,t;
```

printf ("enter the values in");

scanf ("%d %d", &a, &b);

printf ("before swapping a=%d in b=%d\n", a, b);

a = a+b;

b = a-b;

a = a-b;

Op:-	$b = a - b$	\Rightarrow	$a = a - b \Rightarrow a = a + b$
\approx	$b = 30 - 20$		$= 30 - 10 \Rightarrow a = 10 + 20$
	$b = 10$		$a = 20$
	$\begin{matrix} a \\ 20 \end{matrix}$		$\begin{matrix} b \\ 10 \end{matrix}$

Q) Write a 'C' programme to find whether the number is positive or negative.

```
#include <stdio.h>
void main()
```

```
{  
    int a, b;
```

printf ("enter the values n in");

scanf ("%d", &n);

~~printf ("")~~ (n>0)? printf ("even no."): printf ("odd")

```
}
```

Q. Write a C programme to find whether
a person is eligible or not.

```
#include <stdio.h>
```

```
Void main()
```

```
int n, x;
```

```
printf ("Enter n and x");
```

```
scanf ("%d %d", &n, &x);
```

```
(n >= 17) ? printf ("Eligible") :
```

```
printf ("n >= 18) ? (eligible) : printf ("Not Eligible")
```

```
}
```

O/P

enter - 16

not eligible.

25/9/19 Expression Evaluation in C

In C programming, the expression evaluation is based on operator President and operator associativity.

An expression is a combination of operators and operants (constants & variable) that reduces to a single value.

Syntax:- Variable = expression

Example:- $x = a + b * c \quad \left\{ \begin{array}{l} a=3 \\ b=2 \\ c=1 \end{array} \right.$
 $y = a * b + c$

$$x = a/b + c - d$$

$$c = 5 * 3 + 4/2 - 1$$

$$= 15 + 2 - 1$$

$$\boxed{c = 16}$$

Operator President & Associativity

① President :- It defines the priority of evaluation of operators in an expressions.

② Associativity :- It defines the order in which the same president operators are evaluated in an expressions.

Hierarchy of Arithmetic Operator

- * / . . → 1st priority
- + - → 2nd priority
- ⇒ * / . . has highest priority than + -.
- ⇒ Binary operators are evaluated from left to right.
- ⇒ Unary operators are evaluated from right to left.

Operators with president & associativity:-

<u>Operator</u>	<u>Associativity</u>	<u>Priority</u>
1. () (functions brackets)	left to right.	1st
2. [] (arrays brackets)		1st
3. { + + - - . &	right to left.	2nd
4. * / . .	left to right	3rd
5. + -		4th
5. > , < , >= , <=	left to right	5th.
	= =	

6. & 8, 11, ! left → right 6th
7. &, 1, () left → right 7th
8. ?, : left → right 8th
9. Assignment right → left. 9th

(=, +, -, *, / =)
% =, /=

Example

$$\begin{aligned} \bullet \quad 9/5 + c * d &= 3/2 + 1 * 4 & \left\{ \begin{array}{l} \therefore a=3 \\ b=2 \\ c=1 \\ d=4 \end{array} \right. \\ &= 1 + 1 * 4 \\ &= 1 + 4 \\ &= 5 \\ \bullet \quad 9 - 9/5 * 5 \% 3 &> 9 * 5 \% 3 \\ &= 9 - 1 * \cancel{0} > 0 & 7 > 1 \end{aligned}$$

85 | 9 | 9

$$\begin{aligned} x &= a - b / 3 + c * 2 - 1 = 10 & \left\{ \begin{array}{l} a=19 \\ b=12 \\ c=3 \end{array} \right. \\ y &= a - b / (c * 3) * (2 - 1) = 7 \\ z &= a - (b / (c * 3) * c) * 2 - 1 = 4 \end{aligned}$$

$$\Rightarrow 17 - 8/4 * 2 + 3 - ++ a$$

$$= \cancel{23} - \cancel{++ a} \quad 17 - 2 * 2 + 2 + 3 - 6 \quad \boxed{a=5}$$

$$\cancel{12} - \cancel{2} \quad \cancel{13} + 3 - 6$$

$$*(8 / (2 * (2 * 2))) = 8 / 8 = 1$$

$$* 5 \times 4 + 8 / 2 = 20 + 4 = 24.$$

$$* b / c * a = 36 \quad 12 / 3 * 9 = 36 \\ = \cancel{36} - \cancel{36}$$

Q) To evaluate C expression

```
#include <stdio.h>
Void main()
{
    int a, b, c;
    float x, y, z;
    a = 9, b = 12, c = 3;
    printf (
        "#include <stdio.h>\n"
        "Void main()\n"
        "{\n"
        "    int a = 9, b = 12, c = 3;\n"
        "    float x, y, z;\n"
        "    x = a - b / 3 + c * 2 - 1;\n"
        "    y = a - b / (c + c) * (2 - 1);\n"
        "    z = x - (b / (c + c) * 2) - 1;\n"
        "    printf(\"x = %.f\\n\", x);\n"
        "    printf(\"y = %.f\\n\", y);\n"
        "    printf(\"z = %.f\\n\", z);\n"
        "    Scanf (" " %d %d %d %.1f %.1f %.1f ", &a, &b, &c, &x, &y, &z);
    }
```

(x, &x, &y, &z);

3.

Type Conversion (or) Type Casting:-

Type conversion is also called type casting.
Type conversion refers to changing an
variable of one data type into another
data type is called type conversion.

There are two of type conversion.

① Simplicit type conversion:-

It is called as automatic type
casting/conversion. It performs/done by
the compiler. The compiler will automatically
change or convert one type of
data onto another type.

Eg:- int a=20.5;

printf("%d", a);

float f="20"

Eg:- float f=20

printf("%f", f);

"20.0"

Comments. int=choice

char c='A';

printf("%c", c); A.

Explicit type conversion.

to print ASCII value.

```
#include <stdio.h>
```

```
void main()
```

```
{
```

```
char c = 'X';
```

```
printf ("%c", c);
```

```
}
```

26/9/19

Explicit type of conversion:-

It is performed by the programmer (user).

Syntax:- (datatype) expression;

Example:-

* int a = 7.0 / 2; } O/P (error)

```
printf ("%d", a);
```

* int a = (int) 7.0 / 2.

printf ("%d", a); } O/P E-TC from float to int.

* int a = 7 % b;

```
float c = (float) a/b;
```

```
printf ("%f", c);
```

O/P
E-TC from int to float
= 3.5

* float $a = 45.0$, $b = 5.5$, $c = 6.5$
 $d = (\text{int})a + (\text{int})b + (\text{int})c$

Type casting meaning:-

Type cast

(int) 7.0 ;

(int) a + b ;

(int) (a+b) ;

Meaning

7.0 converted to int.

'a' value is converted to int then added to 'b'.

The result of expression is converted to int.

TEST

10, a) Define a flow chart with example?

b) Define an algorithm with example? (or)

10, a) Define Pseudo code? write Pseudo code addit of 2 num.

b) Define tokens & list out types of tokens (or)

10, a) Define Identifier & write rules

b) Difference b/w compiler & Interpreter (or)

10, a) Evaluate $9 - 9 \frac{1}{5} * 5 \% 3 > 9 \%, 5 \% 3$

(or)

b) Give the format of conditional operator & when it is used.

5Q, a) Type conversion with example?

(or)

b) Imp of precedence & associativity?

6Q, a) Explain Increment & Decrement with ex?

(or)

b) Size of operator with example program

C language is used for develop desktop application & system software.

Some applications of 'c' language are

1. 'c' programing language can be use to design the system software like operating systems (window & Unix).
2. To develop system software like data base (sql, my sql).
- 3 It can be to design network devices.
- 4 Used in writing embeded software & also to develop compilers, assemblers, & interpreters.
